Problem Statement

The Problem:

Typing is an important skill for students and professionals, but many people struggle to improve their speed and accuracy. Existing typing websites often have:

- Cluttered interfaces and distractions
- Limited real-time feedback
- Difficulty tracking progress and identifying mistakes
- Reduced motivation over time

Therefore, a simple, distraction-free typing platform with real-time feedback and performance tracking is needed.

Proposed Solution

TypeShift

TypeShift is a modern typing platform that helps users improve speed and accuracy in a simple, distraction-free environment.

Key features of the solution:

- Provides **real-time feedback** and highlights mistakes instantly
- **Tracks performance** over time
- **Clean interface** for smooth, focused practice sessions
- Helps users **monitor progress** continuously

Project Overview

TypeShift is a web-based tool built to help users track and improve their typing performance. The platform provides a focused environment for testing speed and accuracy, with a backend designed to store and display progress over time.

User Authentication
A dedicated login gateway featuring username and password inputs, along with a registration link for new users.

Typing Environment
A centralized "testbox" area for the core typing experience with timers for 30, 60, and 120 seconds.

Navigation Bar
A consistent header providing quick access to the typing test and user profile.

Performance Dashboard
A profile page that tracks individual user stats including Average WPM, Total Tests Started, and Recent Tests.

Project Comparison

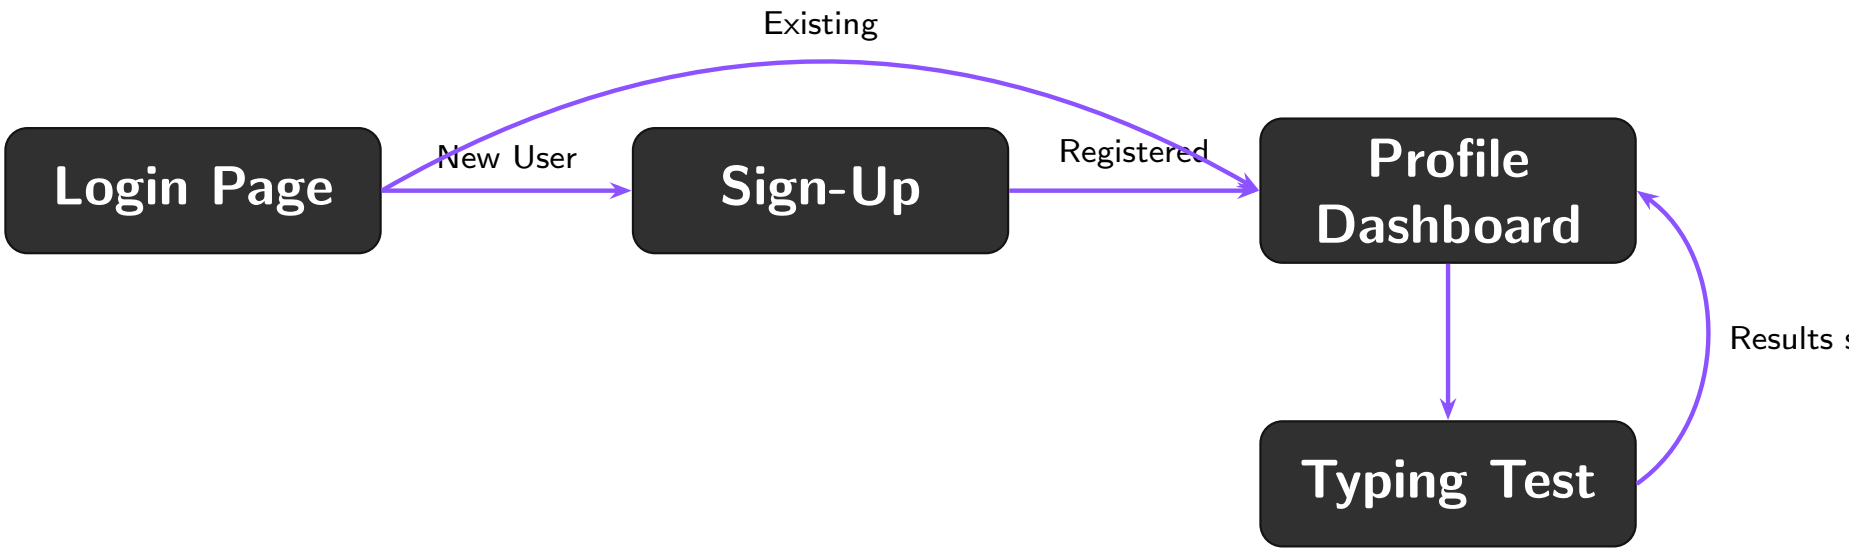
We will **aim** to achieve these features after implementing a basic prototype.

Feature	**MonkeyType**	**TypeRacer**	**TypeShift**
Custom word lists	Limited	×	✓
Typing level	Limited	×	✓ (30/60/120s)
Personal progress graph	✓	×	✓
Leaderboard	×	✓	✓
Reaction on mistype	×	×	✓
Login & personal records	✓	✓	✓

Tools Used

1. **Frontend**
   - **JavaScript** – Core client-side language
   - **React** – Dynamic, component-based UI
   - **HTML5 & CSS3** – Structure & styling
2. **Backend**
   - **Node.js** – Server-side logic
   - **Express.js** – API and server routes
3. **Database**
   - **PostgreSQL** – User accounts, statistics, leaderboard
4. **Other Tools**
   - **Git** – Version control
   - **GitHub** – Code management & collaboration
   - **Vite** – Fast dev server with HMR

Workflow



Login / Register → Profile Dashboard → Timed Typing Test → Results saved to stats

Typing Test Environment

Status of Work Done

✓ **Completed**

- User Registrations
- User login authentication
- Database storage (PostgreSQL)
- Average WPM & total tests taken
- Recent test data display
- Switching between 30/60/120s modes
- Leaderboard integration

○ **Planned**

- Dark / Light mode toggle
- Password resetting
- Editing profile data

The End

Thank You for Listening
